Introduction

Transportation is not just a means to reach places of interest, but it's also a necessity for individuals and families to make living. Transportation allows families to get to school, grocery stores, health clinics, day care, and places of employment.¹ Without sufficient transportation, families and individuals suffer from diminished well-being and social inclusion.² Transportation is especially essential to the lives of the poor, but access to transportation disproportionately affects poorer households.³ Poorer households have limited access to essential destinations such as employment, grocery stores, and medical care.⁴ On average, households that make less than \$10,000 a year make about 1,300 less trips per year than all households.⁵ Automobile ownership is strongly correlated with higher employment rates in all income brackets,⁶ but lower class individuals are much less likely to own automobiles.⁷ As a result, low-income adults are more likely to travel by public transit, walking, or biking.¹

Not only do poorer households miss out on opportunities because of transportation barriers, but an abundance of research argues that the expenditures associated with transportation disproportionately impose heavy burdens on low-income households.⁸ In order to save money for transportation, low-income families must utilize a number of strategies to manage costs, including: reducing total miles traveled, chaining trips together, sharing rides with neighbors and friends, reducing spending on entertainment, and sometimes even reducing spending on essentials, such as food.^{3,9}

While there is research that explores how transportation barriers affect the ability of low-income, urban households to acquire food, there is very little, if any, research that explores the transportation barriers faced by guests of food banks. The purpose of this project is to better understand the transportation patterns of the guests of an urban food bank, the barriers to transportation that these guests face, and how these guests get their food home. Quantitative surveying will be used to gain insight into this population. The following steps will guide the process:

1. All surveys will be administered at Despensa de la Paz Food Bank where the clients go to receive food.
2. Survey administration will be conducted by Daniel Sterba, M3 and other CITI trained volunteers.
3. The student or volunteer will approach individual guests and ask them if they would like to participate in the survey during their visit to the pantry. The volunteer will also offer a fun-sized Starburst candy to the guest as a token of gratitude for their consideration. Guests will be offered the candy regardless of whether or not they decide to participate.
4. Guests will be given an introduction and overview of the study. They will be informed that the study is completely voluntary. They will be told they can stop the study at any time. They will then be asked if they would like to participate in the study.

5. If the guest wants to participate, he or she will be given a survey, clipboard, and pen in order to complete the survey. If the guest does not want to participate, no further action is required.
6. All study subjects will be adults with the ability to understand the study and consent to participate.
7. The surveys will be available in both English and Spanish and will take about 5-10 minutes to complete.
8. Subjects will receive a written and oral overview of the research and the informed consent will be administered in oral form.
9. Subjects will have time to ask questions about the survey.
10. Subjects can decline to answer any question and can withdraw from the study at any time during the process.
11. We will need to approach 550 people in order to get 450 to consent. We anticipate 385 will complete the survey. 385 responses should be sufficient to complete the project.
12. The completed surveys will be coded and placed in a password protected computer file.
13. The data will be statistically analyzed for correlation and dependence (Chi-squared analysis).
